Ubiquiti Networks Set to Bridge Digital Divides with NanoStation

SAN JOSE, February 21, 2008 -- Ubiquiti Networks, a leading innovator in outdoor broadband wireless technologies, today announced NanoStation -- a revolutionary fully integrated outdoor wireless device designed to bridge digital divides throughout the world.

The Nanostation is a breakthrough in price and performance for the Wireless Internet Service Provider Industry. Featuring a compact design weighing just .4kg, the NanoStation integrates a 14dBi smart antenna system, weather proof enclosure, an advanced RF hi-power architecture, and a powerful Operating System with advanced wireless and routing features -- all at an MSRP of \$79.

"Digital divides are still very prevalent throughout the world today. While technologies such as WiMax and 3G might be good solutions for some parts of the world, for many other parts, the capital expenses of deploying these networks cannot be justified from a business perspective. With NanoStation, we set out to develop a product that would redefine the business cases for deploying wireless data networks in these parts of the world. From a price/performance perspective, we strongly believe NanoStation is the product that has the potential to bridge the digital divides that have traditionally been past over by wireless operators and we are very excited about the possibilities this product brings." said Robert J. Pera, President at Ubiquiti Networks.

The NanoStation is available in two separate models that operate in the 2.4GHz and 5GHz worldwide unlicensed bands. The product features numerous innovations including a four-way hi-gain smart antenna system utilizing Ubiquiti Adaptive Antenna Polarity (AAP) Technology. Using the internal antenna system, link distances beyond 15km can be achieved. The NanoStation also contains an external antenna option where range can be extended beyond 50km. In field testing, real-world TCP/IP throughput has exceed 25Mbps.

NanoStation is powered by Ubiquiti's AirOSTM featuring enhanced wireless and routing features, multi-language support, and an elegant user interface which can allows for a quick and painless installation process.

NanoStation carries FCC and CE certification and is now shipping with a MSRP of \$79.

About Ubiquiti Networks:

“Ubiquiti Networks” designs, develops and markets groundbreaking flexible, compact wireless broadband equipment ideally suited for network operators, large OEM’s, WISP’s and military applications. “Ubiquiti Networks” products comply with industry broadband standards, including WiMAX, Wi-Fi and are designed to work with standards-based customer premise equipment. For more information, please contact sales@ubnt.com 408-942-3085.

The \$79 NanoStation is a completely integrated 25Mbps+ outdoor wireless device weighing just .4kg and capable of bridging distances outdoors beyond 15km's.
