Ubiquiti Announces New Product Lineup Lead by The Bullet™

San Jose, October 21, 2008 — Ubiquiti Networks, a leading innovator in outdoor broadband wireless technologies, today announces a new product lineup lead by a revolutionary device known as The Bullet™.

The Bullet™ is a carrier class, weather-proof, highly reliable radio system available in a variety of models covering the 2.4GHz and 5GHz worldwide unlicensed bands. It features excellent radio performance, a robust system design to protect against the harshest of environments, and ships with Ubiquiti's powerful, intuitive AirOS firmware.

What makes the Bullet™ unique is its ultra-compact form factor and integrated N-type RF connector which allows the device to be easily paired up with a variety of sector, grid, yagi, and other popular outdoor antenna types. Using the Bullet™, installers no longer have to worry about RF cabling, separate host board systems, enclosures, or mounting brackets. The Bullet essentially introduces a new "zero variable" deployment scenario to installers which carries the potential to eliminate common deployment failures and significantly improve outdoor network infrastructure robustness. It instantly and painlessly turns any antenna into a carrier class outdoor radio system. "We are very excited to introduce The Bullet to the many outdoor wireless service providers throughout the world. We believe the introduction of this device will mark a significant milestone for the industry through allowing carriers worldwide to expand their broadband wireless networks more aggressively and with more confidence." said Robert J. Pera, President of Ubiquiti Networks.

The Bullet™ is now shipping with a starting MSRP of \$39 USD. Additionally, Ubiquiti has introduced several other new products including [NanoStation Loco](#), [Pico Station](#), and [RouterStation](#). For more information, visit www.ubnt.com

About Ubiquiti Networks:

"Ubiquiti Networks" designs, develops and markets groundbreaking flexible, compact wireless broadband equipment ideally suited for network operators, large OEM's, WISP's and military applications. "Ubiquiti Networks" products comply with industry broadband standards, including WiMAX, Wi-Fi and are designed to work with standards-based customer premise equipment.
